

Benchmark run full detail

Run ID: 20260428T205422Z_pure_full

Generation model: ollama / qwen2.5:7b-instruct

Standard validator: not configured

Layer 1 uses sentence-transformer greedy one-to-one matching at threshold 0.55. Layer 2 uses a checklist-based Gemini judge with strict and weighted scoring.

Document: 0000_cctns

Part A - Document header

Document ID	0000_cctns
Generation model	ollama / qwen2.5:7b-instruct

Evidence / Propositions / Gap	128 / 66 / 4
Grounded after rewrite	66

Part B - Generated dialogue transcript

[SYSTEM] To start, what is the overall purpose and scope of this system?

[USER] This project is based on the 0000 - cctns system, and the goal is to capture the main requirements and constraints for document 0000_cctns.

[SYSTEM] Can you provide examples of frequently-executed transactions in the system to help us understand which processes should have fewer interactions?

[USER] Our users frequently need to place orders and check their order status. Ideally it would be great if these processes could be completed in just a few clicks. For placing an order, we should streamline the process so that customers can add items to their cart, proceed to checkout with minimal steps, and complete payment without too many interactions. Similarly, checking order status should only require logging in or entering an order number, then viewing the current status page which displays all relevant information like delivery date and tracking details. We've had issues where users get frustrated if they have to go through multiple screens just to find out their order status or complete a purchase.

[SYSTEM] Are there any specific steps or information that users need to provide during the order placement process that could be simplified or pre-filled based on their previous interactions?

[USER] We've had issues with customers having to re-enter the same information every time they place an order. It would be great if we could pre-fill some of this data based on their previous interactions. For example, when a customer logs in and starts a new order, it should recognize them and auto-populate fields like shipping address and payment method where applicable. This will save them time and reduce errors. Ideally, it would also allow us to show any saved payment details securely so they can just confirm or change if needed.

[SYSTEM] Are there any common scenarios where users might need to place multiple orders simultaneously or manage a list of items across different orders?

[USER] We need the system to handle scenarios where users might place multiple orders simultaneously. For example, a user shopping on their mobile device could add several items to their cart and checkout all at once. It should be able to manage a list of items across different orders, so that if they start one order but then want to make another, they can easily switch between them without losing any items. This is important because our users expect a seamless shopping experience, especially when they are in a hurry or buying multiple items at once.

[SYSTEM] How important is it to allow users to customize the menu contents based on their role or preferences within the system?

[USER] It's really important that users can customize their menu contents based on their role or preferences. For example, a manager might want to see different options than an entry-level user. We need to ensure the page length is appropriate for each task, and we should use color carefully, considering accessibility issues. Familiar terms are key — navigation links should be intuitive, using language that users will recognize from their experience with similar systems.

[SYSTEM] Could you provide more details on the types of non-text media objects that are commonly used in the system, so we can ensure they are all appropriately described with text equivalents?

[USER] We need to ensure that all non-text media objects are appropriately described with text equivalents. For example, graphical images or videos should have alternative descriptions provided. This is important for accessibility and ensuring everyone can understand the content. We also want to make sure our user interfaces allow activation of controls through a variety of input devices, not just keyboards or mice. Additionally, we need to follow ISO 9241-303 guidelines for screen text legibility to ensure readability.

[SYSTEM] Given the importance of accessibility, could you provide more details on how users with visual impairments typically interact with your system currently, and what specific features or tools they might rely on?

[USER] We know that users with visual impairments rely heavily on screen readers and other assistive technologies. Currently, some of our pages have a splash screen which can be an issue because it might not always allow for easy navigation using these tools. Ideally, we should offer a skip link to bypass the splash screen so they can get straight to the content they need. Additionally, placing page titles consistently in a prominent location would help them understand where they are and what information is available. We also want to avoid horizontal scrolling as much as possible because it can be difficult for users with visual impairments to navigate using screen readers. Lastly, we should ensure that navigation components like menus and links are placed consistently across the application so that users can predict where to find important features.

[SYSTEM] Can you provide examples of common user actions where resizing text would be particularly helpful, and how it might enhance their experience with the application?

[USER] Sure! Resizing text would be particularly helpful for users who have visual impairments or just prefer a larger font size. For example, when reading long articles or filling out forms, being able to increase the text size can make it much easier on the eyes and improve readability. This is especially important in our Help Module where detailed instructions are provided; making sure these instructions are easily readable could significantly enhance user experience. Additionally, using frames with care is crucial. We should ensure that when users navigate through different sections of the application, they don't encounter issues like broken back button functionality or bookmarking problems. It's also important to make it clear when individualization and adaptation features are in use, so users know their preferences have been applied correctly.

[SYSTEM] Could you describe the typical workflow of a user who frequently needs to skim through long text pages, and how our current implementation might be hindering their ability to quickly find relevant information?

[USER] Our users often need to quickly scan through long text pages for specific information. Currently, the system can be a bit cumbersome because it has too many links that make the text hard to read at a glance. We should provide an alternative text-only page as well, which would allow them to skim without getting distracted by hyperlinks. To support skimming better, we need clear links, bulleted lists, highlighted keywords, and logical headings. The links themselves should be marked with dashed underlines instead of solid ones to avoid overwhelming the user. It's important that our interface follows a consistent design so users can easily navigate and find what they're looking for without feeling lost or confused.

[SYSTEM] How can we ensure that the context-sensitive help material is easily accessible and relevant to users when they need it most during their tasks in the application?

[USER] We need to ensure that users can easily find help when they need it. For instance, having a site map would be great for giving an overview of the application structure. Each page should have a link back to the home or a recognizable landmark page. The context-sensitive help material is crucial — we want detailed guidance for every action and scenario in the app. To make sure users can understand the text quickly, we'll use short sentences, break up long texts into chunks, and present information as bullet points.

[SYSTEM] Can you provide examples of specific tasks or scenarios where users might need context-sensitive help, and what kind of assistance would be most beneficial for them?

[USER] We need to ensure that users can easily understand where they are in the application. For example, when a user is filling out a form for creating an account, it should clearly indicate which step they're on and how many steps remain. It's important that the system provides context-sensitive help at these points, like tooltips or inline instructions, to guide them through the process without confusion. Additionally, we need to make sure that our text quality is top-notch; spelling and grammar must be impeccable so as not to impede readability. This is especially crucial for users who might have special needs, such as those with visual impairments or cognitive disabilities. For instance, screen readers should be able to navigate through the application smoothly without any issues. We've had issues in the past where poorly written text caused confusion and slowed down user interactions. Ideally, it would be great if we could offer a variety of support features both within the app and through a browser interface. If someone needs help with something specific, they should be able to access that information quickly without having to navigate away from their current task.

[SYSTEM] Could you provide more details on how the application currently handles navigation for users with cognitive disabilities, and what improvements could be made to better support this user group?

[USER] We need to ensure that our application follows the principles of human perception when designing pages. It's important for users with cognitive disabilities to have a clear understanding of where they are in the navigation structure. Each page should provide this information clearly and succinctly. Ideally, it would be great if we could minimize the number of steps needed to reach any piece of content while still respecting different mental models and tasks that our users might have. Currently, we've had issues with too many clicks required to get to certain sections, which can be frustrating for everyone but especially problematic for those with cognitive disabilities. We should aim to streamline navigation as much as possible. Additionally, it's crucial that the application uses a consistent set of user interface rules throughout. This will help create a familiar and common look and feel, making it easier for all users to navigate.

[SYSTEM] Could you provide examples of how the application currently distinguishes within-page links from external ones to ensure they are clearly marked and accessible for users with visual impairments?

[USER] Currently, within-page links are underlined and appear in a different color than external links to make them stand out. We use color carefully, considering that some users might have difficulty distinguishing certain colors, so we rely on both color and text to convey information. For example, when a link opens a new window or tab, it includes an icon next to the text to indicate this, ensuring that all users can easily identify such links.

[SYSTEM] Could you provide examples of specific scenarios where users might attempt unauthorized access to cases, and how logging these attempts could help in security audits?

[USER] In our system, there are several scenarios where unauthorized access to cases might occur. For example, a user with limited permissions might try to view or modify a case they do not have access to. Another scenario could be an external attacker attempting to gain access through weak passwords or exploiting vulnerabilities in the application. Logging these attempts is crucial because it helps us track who tried what and when, which is vital for security audits. By exporting audit trails for specific cases without affecting the stored data, we can review these logs later if needed. This ensures that all activities related to cases are recorded, making our system legally admissible and aiding in data recovery efforts. The audit trail must be unalterable—no one should be able to change or delete it, ensuring its integrity.

[SYSTEM] Could you describe the process for creating and managing user profiles in our application, and how this might change based on different roles or departments within the organization?

[USER] For user profiles in our application, we need a way for users to log any defects or enhancement requests and track them. This is important because it helps us address issues quickly and improve the product based on customer feedback. Regarding profile management, only super-users should be able to change security attributes like access rights, security levels, privileges, and password management. Users should have the ability to see, modify, and delete their own profiles as needed. This ensures that each user can manage their own information while maintaining a high level of security through strict control over who can make changes.

[SYSTEM] Can you provide examples of how the current system handles data validation for user input, and what specific challenges or pain points have been encountered during this process?

[USER] Currently, the system handles data validation by checking user input against predefined rules. For example, we allow users to define their own default values for certain fields, which is really helpful when they need to enter similar information repeatedly. However, there have been some challenges with this approach. Sometimes, error messages can be unclear or too technical, leading to confusion among our users. We've had issues where the system doesn't provide clear instructions on how to correct the input, making it difficult for them to resolve errors themselves. Ideally, we would like the system to give more actionable feedback and suggest possible fixes. Additionally, while persistent defaults are useful, there have been times when they caused problems because users forgot to update their settings. We need a way to ensure that these defaults can be easily changed or overridden if necessary. Overall, registration complaints often come up due to misunderstandings about the validation rules, so we're looking for ways to improve both the clarity of our error messages and the overall user experience.

[SYSTEM] Could you provide more details on how the system currently handles user-defined default values and any issues that arise from this approach during data validation?

[USER] Currently, the system allows users to define default values which are quite useful for streamlining processes. However, we've had issues with data validation when these defaults don't align with our international standards. For example, AUTO-0082 requires us to consult specific International Standards for guidance, but sometimes user-defined defaults can conflict with those guidelines. Ideally, it would be better if the system could automatically check against these standards during validation. Registration citizens often use this feature to report complaints to the police, and while it's helpful, we need a way to ensure that any default values entered by users are compliant with our legal requirements for evidence collection and investigation. AUTO-0001 emphasizes the importance of following these procedures, so we must find a balance between user convenience and strict adherence to regulations. Additionally, we've noticed that relying solely on color coding can be problematic, as it should never be the only means of conveying important information. That's why we need robust validation checks in place to catch any discrepancies.

[SYSTEM] How can we improve the clarity and specificity of error messages when user-defined defaults conflict with international standards during data validation?

[USER] We need clear and specific error messages when user-defined defaults conflict with international standards. For example, if a user sets a date format that doesn't match the ISO standard, we should inform them about the correct format and suggest using something like YYYY-MM-DD. Ideally it would highlight the incorrect part of their input directly in the field. That's important to us because users might not be familiar with international standards and need guidance on how to adjust their settings.

[SYSTEM] Could you provide more details on the types of specialist software that will be integrated with our system and how their interface guidelines should influence the design?

[USER] We need the system to be highly customizable and user-configurable where possible. This is important because we might integrate with various specialist software tools that have specific interface guidelines. For example, our users should be able to adjust settings according to their needs, making sure everything remains intuitive and easy to use for both end-users and administrators. The design must follow broad guidelines such as supporting multilingual interfaces, which will cater to a diverse user base. Additionally, the system should ensure that no operational data is lost in case of equipment or communication network failures.

[SYSTEM] Could you provide more details on the expected range of technical contexts for opening and downloading times, such as different devices or network conditions, to help us understand better how to meet these performance capacity requirements?

[USER] We need the system to handle different devices and network conditions smoothly. For cases accessed within the last two months, it should be able to retrieve and display them within 5-8 seconds — this is crucial for a good user experience. Even when there are many cases or limited storage capacity, we expect this performance. For older cases not accessed in the past two months, retrieval and display should happen within 20 seconds. This ensures that while less frequently used data can take longer to load, it still meets our needs without causing significant delays.

[SYSTEM] Could you specify the types of devices and network conditions we should consider for ensuring acceptable opening and download times?

[USER] We need to ensure that our application performs well across a variety of devices and network conditions. Specifically, we should consider opening times and download times for both desktops (Windows 10, macOS Catalina) and mobile devices (iOS 14+, Android 9+). The system should be able to handle at least 1000 concurrent users without significant degradation in performance. Ideally, pages should open within less than 2 seconds under normal network conditions. For slower networks or lower-end devices, we expect the opening time to be no more than 5 seconds. It's important that our application can handle a range of internet speeds from fast Wi-Fi to slow 3G connections.

[SYSTEM] Could you specify the acceptable downtime periods and incident limits for our system during critical operations or maintenance windows to ensure we meet your reliability requirements?

[USER] For our system, we need the planned downtime to be kept to a minimum. Ideally, it should not exceed 8 hours in any rolling three-month period. Unplanned downtime is also critical; it must not happen more than twice during that same period. When an incident does occur, whether due to software or hardware failure, we expect the system to be restored within no more than 4 hours, with inline synchronization as part of the recovery process.

[SYSTEM] Could you provide more details on how the role-based permissions will be enforced for different types of searches and what specific actions users in each role should be able to perform?

[USER] For role-based permissions, we need to ensure that when a user performs a quick or advanced search, the system never includes any records in the result list that they don't have access to. This is important for maintaining data security and privacy. Additionally, it should be possible for users to belong to more than one group, allowing for flexible role assignments based on their tasks and responsibilities. When designing different access paths or navigation structures for various user groups, we need to consider the specific tasks and information needs of each group to ensure they can efficiently find what they need.

Part C - Extracted requirements by category

Functional

- FR-001** Users can place orders with minimal steps, adding items to their cart, proceeding to checkout, and completing payment without too many interactions.
- FR-002** Users can check their order status by logging in or entering an order number, then viewing the current status page which displays all relevant information like delivery date and tracking details.
- FR-003** Users should not have to re-enter the same information every time they place an order; data from previous interactions can be pre-filled.
- FR-004** When a customer logs in and starts a new order, the system should recognize them and auto-populate fields like shipping address and payment method where applicable.
- FR-005** The system should allow users to view and confirm or change any saved payment details securely.
- FR-006** The system should handle scenarios where users might place multiple orders simultaneously, allowing them to add several items to their cart and checkout all at once.
- FR-007** The system should manage a list of items across different orders, enabling users to easily switch between them without losing any items.
- FR-008** Users can customize their menu contents based on their role or preferences.
- FR-009** Super-users should be able to change security attributes like access rights, security levels, privileges, and password management.
- FR-010** Users should have the ability to see, modify, and delete their own profiles as needed.
- FR-011** The system should provide clear instructions on how to correct input errors.
- FR-012** Users should be able to easily change or override persistent default values.
- FR-013** Users should have the ability to adjust settings according to their needs.
- FR-014** When a user performs a quick or advanced search, the system must not include any records in the result list that they do not have access to.
- FR-015** Users should be able to belong to more than one group, allowing for flexible role assignments based on their tasks and responsibilities.
- FR-016** Users should be able to log defects or enhancement requests in their profiles.

Non-Functional

- NFR-001** All non-text media objects should be appropriately described with text equivalents.
- NFR-002** User interfaces should allow activation of controls through a variety of input devices, not just keyboards or mice.

NFR-003	Splash screens should be bypassable using a skip link to facilitate navigation for users with visual impairments.
NFR-004	Page titles should be consistently placed in a prominent location to help users understand where they are and what information is available.
NFR-005	Horizontal scrolling should be minimized to aid users with visual impairments in navigating the application.
NFR-006	Navigation components like menus and links should be consistently placed across the application.
NFR-007	Navigation components like menus and links should be consistently placed across the application so that users can predict where to find important features.
NFR-008	Resizing text would be particularly helpful for users who have visual impairments or just prefer a larger font size.
NFR-009	Text resizing should make it easier on the eyes and improve readability, especially in long articles or detailed instructions like those found in the Help Module.
NFR-010	Alternative text-only pages should be provided to allow users to skim through long text pages without getting distracted by hyperlinks.
NFR-011	The system should use clear links, bulleted lists, highlighted keywords, and logical headings to support skimming better.
NFR-012	Skip links should be offered to bypass splash screens so users can get straight to the content they need.
NFR-013	The system should provide an alternative text-only page to allow users to skim without getting distracted by hyperlinks.
NFR-014	The system should mark links with dashed underlines instead of solid ones to avoid overwhelming the user.
NFR-015	The system should have a site map to give an overview of the application structure.
NFR-016	Each page should have a link back to the home or a recognizable landmark page.
NFR-017	The system should use short sentences, break up long texts into chunks, and present information as bullet points to ensure users can understand the text quickly.
NFR-018	The system should clearly indicate which step a user is on and how many steps remain when filling out a form for creating an account.
NFR-019	The system should provide context-sensitive help at critical points, like tooltips or inline instructions, to guide users through the process without confusion.
NFR-020	The system should ensure top-notch text quality with impeccable spelling and grammar to improve readability.
NFR-021	Screen readers should be able to navigate through the application smoothly without any issues.
NFR-022	The system should minimize the number of steps needed to reach any piece of content while respecting different mental models and tasks.
NFR-023	The application should use a consistent set of user interface rules throughout to create a familiar and common look and feel.
NFR-024	Navigation should be streamlined to minimize the number of steps needed to reach any piece of content while respecting different mental models and tasks.
NFR-025	Within-page links should be underlined and appear in a different color than external links, using both color and text to convey information.
NFR-026	When a link opens a new window or tab, it should include an icon next to the text to indicate this.
NFR-027	Audit trails must be exported for specific cases without affecting the stored data, allowing later review.
NFR-028	Audit trails must be unalterable—no one should be able to change or delete them, ensuring their integrity.

NFR-029	Error messages should be clear and provide actionable feedback.
NFR-030	The system should automatically validate user-defined default values against specific International Standards.
NFR-031	User-defined default values must comply with legal requirements for evidence collection and investigation.
NFR-032	Registration complaints often arise due to misunderstandings about validation rules.
NFR-033	The system should ensure robust validation checks to catch any discrepancies in user-defined default values.
NFR-034	Error messages should be clear and specific when user-defined defaults conflict with international standards.
NFR-035	Error messages should highlight the incorrect part of user input directly in the field.
NFR-036	The system should support multilingual interfaces to cater to a diverse user base.
NFR-037	The system should ensure that no operational data is lost in case of equipment or communication network failures.
NFR-038	The system should retrieve and display cases accessed within the last two months within 5-8 seconds.
NFR-039	The system should handle many cases or limited storage capacity without degrading performance for recently accessed cases.
NFR-040	For older cases not accessed in the past two months, retrieval and display should happen within 20 seconds.
NFR-041	The system should handle at least 1000 concurrent users without significant degradation in performance.
NFR-042	Pages should open within less than 2 seconds under normal network conditions.
NFR-043	For slower networks or lower-end devices, the opening time should be no more than 5 seconds.
NFR-044	The system should handle a range of internet speeds from fast Wi-Fi to slow 3G connections.
NFR-045	Planned downtime for the system should not exceed 8 hours in any rolling three-month period.
NFR-046	Unplanned downtime for the system must not exceed twice in any rolling three-month period.
NFR-047	The system should be restored within no more than 4 hours when an incident occurs, with inline synchronization as part of the recovery process.
NFR-048	The system must log unauthorized access attempts to aid in security audits.
NFR-049	User-defined default values must comply with specific International Standards during validation.
NFR-050	The system should provide support features both within the app and through a browser interface.

Part D - Matched vs missed table

Source requirement text	Matched?	Closest generated requirement text
Registration Citizens can register their complaints with police and then based on the evidence, facts and following investigation, police shall take the complaint forward.	✗	— not recovered
Help Module The solution should provide detailed context-sensitive help material for all the possible actions and scenarios on all user interfaces in the application.	✓	The system should provide context-sensitive help at critical points, like tooltips or inline instructions, to guide users through the process without confusion.
The solution should provide detailed context-sensitive help material for all the possible actions and scenarios on all user interfaces in the application.	✗	— not recovered

Source requirement text	Matched?	Closest generated requirement text
The solution should provide an interface for the user to log any defects or enhancement requests on the application and track thereafter.	✓	Users should be able to log defects or enhancement requests in their profiles.
The solution should send alerts (e.g., email, SMS) to the user if the user chooses to whenever any action has been taken on the alert.	✗	— not recovered
The solution should enable the user to track the submitted defect or enhancement request.	✗	— not recovered
The solution should enable the help-desk user to view the reports on the submitted defects or enhancement requests category-wise, status-wise, and age- wise.	✗	— not recovered
The support solution should be accessible to the users both from within the application and also outside the application through a browser interface.	✓	The system should provide support features both within the app and through a browser interface.
The System must keep an unalterable audit trail capable of automatically capturing and storing information about: All the actions (create/read/update/delete) that are taken upon the critical entities (case, suspect, property,...) in the system The user initiating and or carrying out the action;	✗	— not recovered
Administrative parameters The word “unalterable” is to mean that the audit trail data cannot be modified in any way or deleted by any user;	✓	Audit trails must be unalterable—no one should be able to change or delete them, ensuring their integrity.
it may be subject to re-department and copying to removable media if required, so long as its contents remain unchanged.	✗	— not recovered
Once the audit trail functionality has been activated, the System must track events without manual intervention, and store in the audit trail information about them.	✗	— not recovered
The System must maintain the audit trail for as long as required, which will be at least for the life of the case to which it refers.	✗	— not recovered
The System must be able to export audit trails for specified cases (without affecting the audit trail stored by the System).	✓	Audit trails must be exported for specific cases without affecting the stored data, allowing later review.
The System must be able to capture and store violations (i.e.	✓	The system should ensure that no operational data is lost in case of equipment or communication network failures.
The System must at a minimum be able to provide reports for actions on cases organised: By case;	✗	— not recovered
The System should be able to provide reports for actions on cases organised by workstation and (where technically appropriate) by network address.	✗	— not recovered
The System must allow the user to limit access to cases to specified users or user groups.	✗	— not recovered
The system should provide for role-based control for the functionality within the system The System must allow a user to be a member of more than one group.	✓	Users should be able to belong to more than one group, allowing for flexible role assignments based on their tasks and responsibilities.
The System must allow only admin-users to set up user profiles and allocate users to groups.	✗	— not recovered

Source requirement text	Matched?	Closest generated requirement text
The System should allow a user to stipulate which other users or groups can access cases.	✗	— not recovered
The System must allow changes to security attributes for groups or users (such as access rights, security level, privileges, password allocation and management) to be made only by super-user.	✓	Super-users should be able to change security attributes like access rights, security levels, privileges, and password management.
If a user requests access to, or searches for, a case which he does not have the right to access, the System must provide one of the following responses (selectable at configuration time): display title and metadata;	✗	— not recovered
the most stringent) implies that the System must not include such cases in any count of search results;	✗	— not recovered
If a user performs a quick or advanced search, the System must never include in the search result list any record which the user does not have the right to access.	✓	When a user performs a quick or advanced search, the system must not include any records in the result list that they do not have access to.
If the System allows users to make unauthorised attempts to access cases, it must log these in the audit trail.	✓	The system must log unauthorized access attempts to aid in security audits.
Any access to cases, and all other activities involving the cases and related documents or data should also need to be stored in the audit trail to ensure legal admissibility and to assist in data recovery.	✗	— not recovered
Ease of Use All error messages produced by the System must be meaningful, so that they can be appropriately acted upon by the users who are likely to see them.	✗	— not recovered
The System must employ a single set of user interface rules, or a small number of sets to provide a familiar and common look and feel for the application.	✓	The application should use a consistent set of user interface rules throughout to create a familiar and common look and feel.
The System must be able to display several entities (cases, suspects) simultaneously.	✗	— not recovered
The interfaces must be made customizable or user-configurable to the extent possible.	✗	— not recovered
Such configurations must be saved in the user profile.	✗	— not recovered
The System user interface must be suitable for users with special needs;	✗	— not recovered
that is, compatible with specialist software that may be used and with appropriate interface guidelines The System must provide End User and Administrator functions which are easy to use and intuitive throughout.	✗	— not recovered
The System must allow persistent defaults for data entry where desirable.	✓	Users should be able to easily change or override persistent default values.
These defaults should include: user-definable values;	✗	— not recovered
Frequently-executed System transactions must be designed so that they can be completed with a small number of interactions (e.g.	✗	— not recovered
Where the System employs a graphical user interface, it must allow users to customise it.	✓	Users should have the ability to adjust settings according to their needs.

Source requirement text	Matched?	Closest generated requirement text
Customisation should include, but need not be limited to the following changes: menu contents;	✓	Users can customize their menu contents based on their role or preferences.
Usability The user interfaces should be designed to make them user-intuitive.	✗	— not recovered
The user interfaces of the system should comply with Standard ISO 9241.	✗	— not recovered
ICT accessibility: ISO 9241-20 shall be the standard for guidance on ICT accessibility.	✗	— not recovered
Software accessibility ISO 9241-171 shall be the standard for guidance on software accessibility.	✗	— not recovered
User interfaces should meet its requirements and recommendations.	✗	— not recovered
Content accessibility WCAG 1.0 shall be the standard used for guidance on content accessibility.	✗	— not recovered
Providing text equivalents for non-text media objects: All non-text media objects, such as graphical images or video, should be provided with alternative equivalent textual descriptions and/or with equivalent text-based functionality.	✓	All non-text media objects should be appropriately described with text equivalents.
Making navigation self-descriptive: Navigation should be designed to help users understand where they are, where they have been and where they can go next.	✗	— not recovered
Showing users where they are: Each presentation segment (page or window) should provide the user with a clear and sufficient indication of where he or she is in the navigation structure and of the current segment position with respect to the overall structure.	✗	— not recovered
Offering alternative access paths: Alternative access paths for navigating to a specific unit of content should be offered to support different navigation strategies.	✗	— not recovered
Minimizing navigation effort: The number of navigation steps needed to reach a certain piece of content should be minimized as long as different mental models, navigation strategies and tasks of the user are taken into account.	✓	Navigation should be streamlined to minimize the number of steps needed to reach any piece of content while respecting different mental models and tasks.
Splash screens should be avoided unless they provide useful content or feedback about the application state to the user.	✓	Skip links should be offered to bypass splash screens so users can get straight to the content they need.
If a splash screen is used, a navigation option to skip it should be offered.	✓	Splash screens should be bypassable using a skip link to facilitate navigation for users with visual impairments.
Avoiding opening unnecessary windows: Additional windows such as new browser windows or pop-up windows should only be opened if this supports the user's task.	✗	— not recovered
Horizontal scrolling should be avoided wherever possible.	✓	Horizontal scrolling should be minimized to aid users with visual impairments in navigating the application.
Designing for input device independence: User interfaces should be designed to allow activation of controls by a variety of input devices.	✓	User interfaces should allow activation of controls through a variety of input devices, not just keyboards or mice.

Source requirement text	Matched?	Closest generated requirement text
Making user interfaces robust: User interfaces should be designed to be as robust as possible in the face of changing technology.	✗	— not recovered
Acceptable opening / download times: Application pages should be designed and implemented so that there are acceptable opening times and download times for the expected range of technical contexts of use (e.g.	✓	Pages should open within less than 2 seconds under normal network conditions.
Minimizing user errors: Potential user errors as well as the effort needed to recover from errors should be minimized.	✗	— not recovered
Providing clear error messages: The content of error messages shown on the pages or special error pages should clearly state the reason why the error occurred and, if possible, actions the user can take to resolve the error.	✓	Error messages should be clear and provide actionable feedback.
Making text resizable by the user: Text should be able to be resized by the user, using functions provided by the user agent or other appropriate means i.e.	✓	Resizing text would be particularly helpful for users who have visual impairments or just prefer a larger font size.
Text quality: The quality of textual content with respect to spelling and grammar should be sufficient so as not to impede readability.	✓	The system should ensure top-notch text quality with impeccable spelling and grammar to improve readability.
Writing style: The reading and understanding of the textual content on the screen should be supported by suitable means, including the use of short sentences, the division of the text into shorter chunks or the presentation of content items in the form of bullet points.	✓	The system should use short sentences, break up long texts into chunks, and present information as bullet points to ensure users can understand the text quickly.
Supporting text skimming: Fast skimming of text should be supported by the provision of clear links, bulleted lists, highlighted keywords, logical headings, and short phrases and sentences.	✓	The system should use clear links, bulleted lists, highlighted keywords, and logical headings to support skimming better.
Readability of text: Text presented on the pages should be readable taking into account the expected display characteristics and spatial arrangement.	✗	— not recovered
ISO 9241-303 shall be consulted for screen text legibility requirements.	✗	— not recovered
Distinguishable within-page links: Within-page links should be clearly distinguishable from other links that lead to a different page.	✓	Within-page links should be underlined and appear in a different color than external links, using both color and text to convey information.
Within-page links are shown with dashed rather than solid underlines Avoiding link overload: Text pages containing large proportions of links should be formatted so that the presence of links does not impede the readability of the text.	✓	The system should mark links with dashed underlines instead of solid ones to avoid overwhelming the user.
Using familiar terminology for navigation links: Navigation links — particularly links representing the main navigation structure — should be labelled with terms that are familiar to the user, based on his/her general knowledge, prior experience in the application domain or experience of using other systems.	✗	— not recovered
Marking links opening new windows: Links that open new browser windows or pop-up windows should be clearly marked.	✓	When a link opens a new window or tab, it should include an icon next to the text to indicate this.

Source requirement text	Matched?	Closest generated requirement text
Distinguishing navigation links from controls: Navigation links should be clearly distinguishable from controls activating some action.	✗	— not recovered
space filled only with the background color should be used in such a way that it does not impair the visual skimming of the page.	✗	— not recovered
Selecting appropriate page lengths The length of a page should be selected so as to support the primary purpose and use of the page.	✗	— not recovered
Using colour: Colour should be used with care, taking into account human capabilities and restrictions in perceiving colour, and not as the only means of conveying information.	✗	— not recovered
Color should never be the only means of coding.	✗	— not recovered
Using frames with care: If frames are used, care should be taken to avoid possible problems, for example, those involving the use of the back button, bookmarking of pages, or scrolling of information.	✗	— not recovered
Providing alternatives to frame-based presentation: If frames are used, an alternative way of presenting relevant information without frames should be provided.	✗	— not recovered
Providing alternative text-only pages: When style sheets and/or frames are turned off it should be possible for the user to read and understand the page;	✗	— not recovered
alternatively, the user should be provided with an equivalent alternative text-only page.	✓	The system should provide an alternative text-only page to allow users to skim without getting distracted by hyperlinks.
Consistent page layout: Pages should be designed using consistent layout schemes, supporting the user in finding similar information at the same position on different pages.	✗	— not recovered
Placing title information consistently: Page titles should be placed in a consistent location on the different pages.	✓	Page titles should be consistently placed in a prominent location to help users understand where they are and what information is available.
Observing principles of human perception When designing application pages, the general principles of human perception should be taken into account.	✗	— not recovered
The International Standards mentioned below shall be consulted for guidance.	✓	User-defined default values must comply with specific International Standards during validation.
In addition, when designing multimedia information presentations, the design principles and recommendations described in ISO 14915-1 to ISO 14915-3 should be taken into account.	✗	— not recovered
Linking back to the home page or landmark pages: Each page should contain a link leading to the home page of the application or to a landmark page that is easy to recognize for the user.	✓	Each page should have a link back to the home or a recognizable landmark page.
Providing a site map: A separate navigation overview such as a site map should be provided for application showing the structure of the site in an overview form.	✓	The system should have a site map to give an overview of the application structure.

Source requirement text	Matched?	Closest generated requirement text
Consistency between navigation components and content: If navigation components (or overviews) are shown in conjunction with associated content, consistency between the navigation component and the content shown should be maintained by indicating in the navigation component (e.g.	✓	Navigation components like menus and links should be consistently placed across the application so that users can predict where to find important features.
Placing navigation components consistently: Navigation components should be placed consistently on the pages or in the framesets in the pages of the application.	✓	Navigation components like menus and links should be consistently placed across the application.
Taking account of the users' tasks and information needs: When providing different access paths or navigation structures for different user groups, the tasks and information needs of these user groups should be taken into consideration.	✗	— not recovered
Making individualization and adaptation evident: It should be made evident to the user when individualization and/or adaptation are used.	✗	— not recovered
Making user profiles evident: If predefined user profiles or user-specified profiles are used for individualizing or adapting content, the profile currently used should be made evident.	✗	— not recovered
Allowing users to see and change profiles: If user-specified profiles are used, users should be able to see, modify and delete that profile on demand.	✓	Users should have the ability to see, modify, and delete their own profiles as needed.
The user interfaces of the system should follow the guidelines specified under www.usability.gov System Availability The System must be available to users: from <xx:00> to <xx:00>;	✗	— not recovered
The planned downtime for the System must not exceed <xx> hours per <rolling three month period>.	✓	Planned downtime for the system should not exceed 8 hours in any rolling three-month period.
Unplanned downtime for the System must not exceed <xx hours/minutes> per <rolling three month period>.	✓	Unplanned downtime for the system must not exceed twice in any rolling three-month period.
The number of incidents of unplanned downtime for the System must not exceed <x> per <rolling three month period>.	✗	— not recovered
In the event of any software or hardware failure, it must be possible to restore the System (with inline synchronization) within no more than <xx> hours.	✓	The system should be restored within no more than 4 hours when an incident occurs, with inline synchronization as part of the recovery process.
The System must be able to retrieve and display within 5-8 seconds the case which has been accessed within the previous 2 months, regardless of storage capacity or number of cases in the system.	✓	The system should retrieve and display cases accessed within the last two months within 5-8 seconds.
The System must be able to retrieve and display within 20 seconds the case which has not been accessed within the previous 2 months, regardless of storage capacity or number of cases in the system.	✓	For older cases not accessed in the past two months, retrieval and display should happen within 20 seconds.
The System be scaleable and must not have any features which would preclude use in small or large police stations, with varying numbers of cases handled.	✗	— not recovered

Source requirement text	Matched?	Closest generated requirement text
The systems should be designed with the following broad guidelines: System Functionality The system should support multilingual interface The system should be designed in manner that operational data is not lost in case of any failure of equipment or communication network.	✓	The system should support multilingual interfaces to cater to a diverse user base.
